

The Emperor's New Autofill Framework: A Security Analysis of Autofill on iOS and Android

Sean Oesch

KNOXVILLE

Background

Motivation and information on mobile autofill frameworks

Motivation

- Prior evaluations focused on desktop managers
- Autofill frameworks are unique to mobile and present their own set of security challenges
 - Could be single point of failure
- We set out to understand three different approaches to an autofill framework on mobile

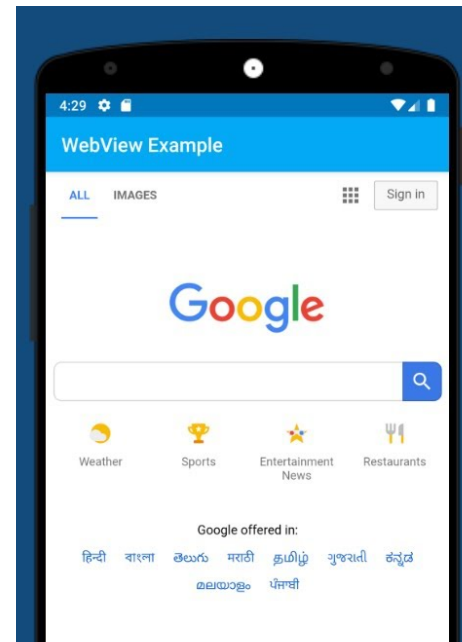

Autofill on Mobile

- Multiple contexts for autofill
 - Browser
 - Apps
- Multiple approaches to autofill

Contexts for Autofill in Apps

Native UI Elements

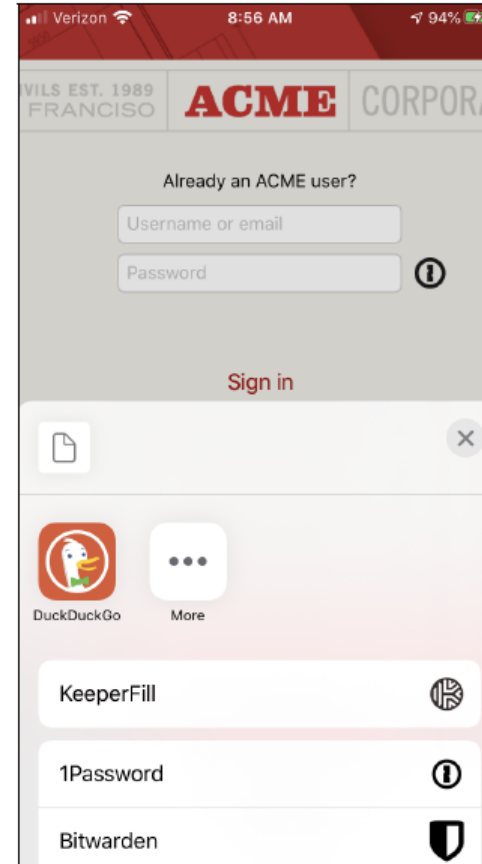

WebView

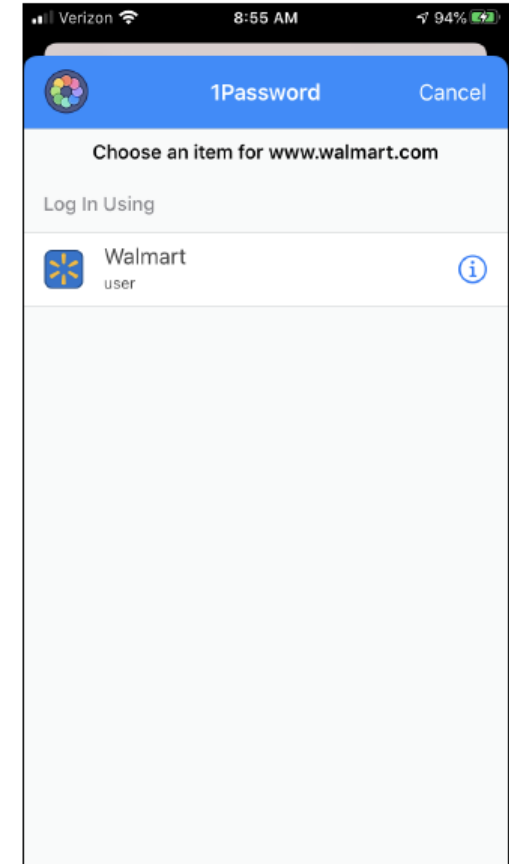

Custom UI Elements

iOS App Extensions

- iOS 8 – 2014
- Popular managers still support – 1Password, Keeper, LastPass
- Older devices – prior iOS 12

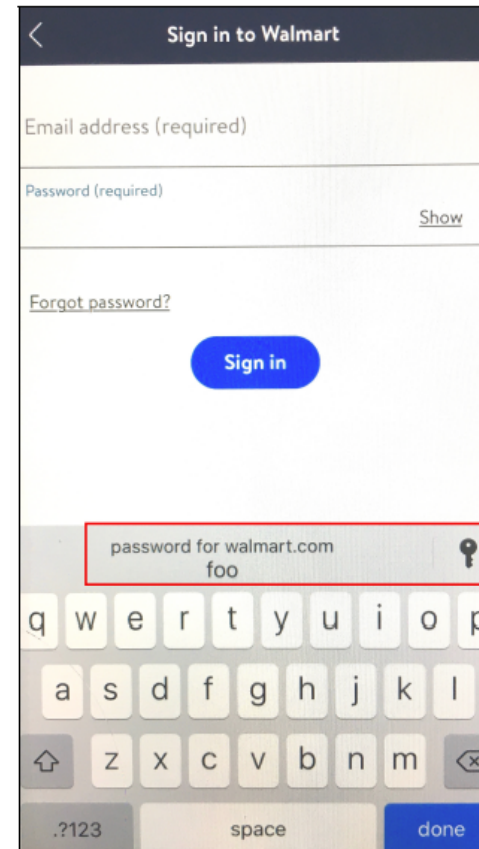

(a) Selecting app extension

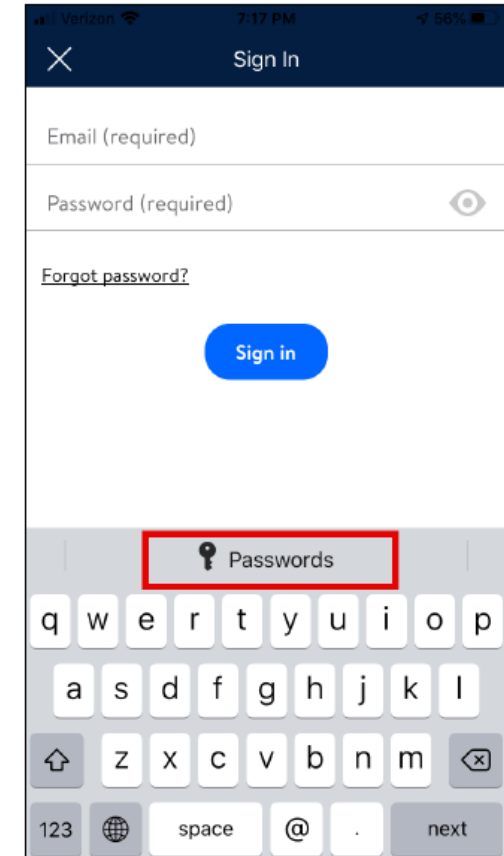

(b) Selecting password

iOS AutoFill

- iOS 12 – 2018
- Controls entire autofill process
 - form identification
 - mapping app and domain
 - user interface
 - autofill

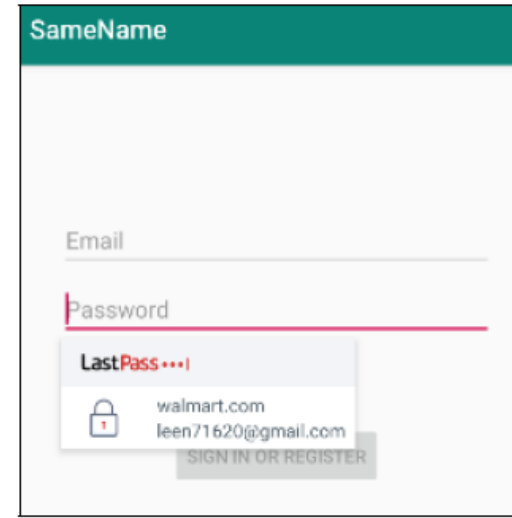

(a) Credential found

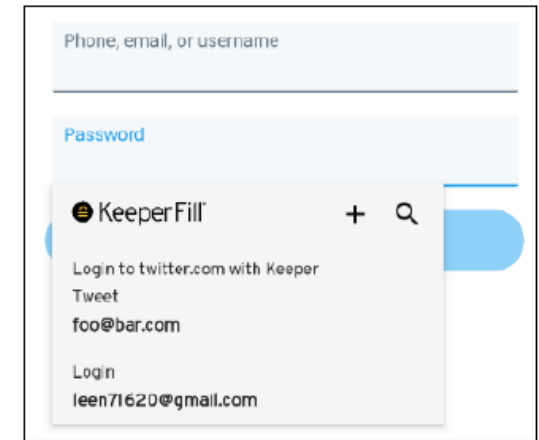

(b) No credential found

Android Autofill Service

- Android 8 (Oreo) 2017 – replaces accessibility service
- Leaves a lot of leeway to individual managers

(a) LastPass

(b) Keeper

Approach

Systematic evaluation of autofill properties and testing methodology

Secure Autofill Properties

- Managers should only fill credentials when:
 - P1: Users explicitly authorize operation
 - P2: Credential is securely mapped to web domain or app
 - P3: Credential is only accessible to mapped domain
- Protects against credential scraping and phishing

Autofill dialogue tells user it is safe to fill credentials

Testing

- Strategy
 - Evaluated 14 managers implemented with the autofill frameworks
 - Considered all three properties in all supported contexts
 - Looking for what the framework enforces, what it fails to enforce, and what it prevents managers from enforcing
- Environment
 - iPhone 7 running iOS 13, using Safari for browser tests
 - Genymotion Android emulator
 - Simulated a Google Pixel 2 running Android 9 (Pie)
 - Chrome for browser

Results

Browser, Native UI Elements, and WebView

Autofill in the Browser

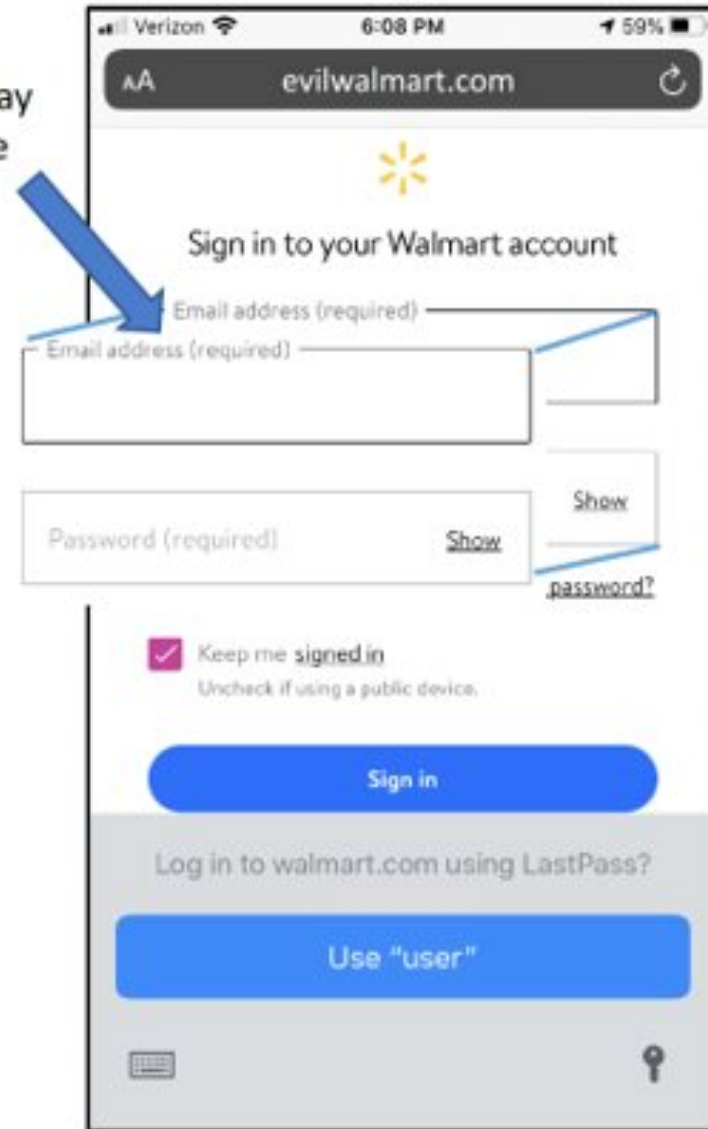

User interaction always required
 Maps credentials to domains
 Won't fill HTTPS → HTTP
 Won't fill HTTPS → HTTP
 Fills password only on transmission
 Won't fill different action (static)
 Won't fill different action (dynamic)
 Won't fill cross-origin iframe

| Framework | P1 | P2 | | | P3 | | | | |
|-----------------------------------|----|----|---|---|----|---|---|---|---|
| iOS Password AutoFill | ● | ● | ○ | ○ | ○ | ○ | ○ | ○ | ○ |
| iOS App Extensions | ● | ● | ○ | ○ | ○ | ○ | ○ | ○ | ● |
| Android Autofill Service | ● | ● | ○ | ○ | ○ | ○ | ○ | ○ | ✎ |
| Most secure desktop manager [48] | ● | ● | ◐ | ● | ○ | ◐ | ◐ | ◐ | ● |
| Least secure desktop manager [48] | ○ | ● | ● | ○ | ○ | ● | ● | ○ | ○ |

- Secure behavior
- ◐ Partially secure behavior
- Insecure behavior
- ✎ Delegated to password manager

Cross-origin phishing attack

Cross-origin iframe overlay of any walmart.com page with XSS vulnerability

Autofill in Native UI Elements

| Framework | P1 | P2 | P3 |
|--------------------------|----|----|----|
| iOS Password AutoFill | ● | ● | ● |
| iOS App Extensions | ● | ○ | ○ |
| Android Autofill Service | ● | ✎ | ✎ |

User interaction always required
 Secure app-to-domain mapping
 Secure domain-to-app mapping
 Prevents access from other apps
 Prevents access from WebView

- Secure behavior ○ Insecure behavior
- ✎ Delegated to password manager

WebView Overview

| Framework | P1 | P2 | P3 |
|--------------------------|----|-------|---------------------|
| iOS Password AutoFill | ● | ● ○ ○ | ○ ○ ○ ○ ○ ○ ○ ○ ○ ○ |
| iOS App Extensions | ● | ✎ ○ ○ | ○ ○ ○ ○ ○ ○ ○ ○ ○ ● |
| Android Autofill Service | ● | ✎ ○ ○ | ○ ○ ○ ○ ○ ○ ○ ○ ○ ✎ |

User interaction always required
 Maps credentials to domains
 Won't fill HTTPS → HTTP
 Won't fill HTTPS → bad cert
 Prevents access from hosting app
 Fills password only on transmission
 Won't fill different action (static)
 Won't fill different action (dynamic)
 Won't fill cross-origin iframe

● Secure behavior ○ Insecure behavior ✎ Delegated to password manager

Violation P2

- Credential should be mapped to website hosted in WebView
- Some managers/frameworks fill the app credentials into any website hosted in WebView
- Users are conditioned to trust autofill dialogues

WebView Overview

| Framework | P1 | P2 | P3 | | | | | | | |
|--------------------------|----|-------|-----------------|--|--|--|--|--|--|--|
| iOS Password AutoFill | ● | ● ○ ○ | ○ ○ ○ ○ ○ ○ ○ ○ | | | | | | | |
| iOS App Extensions | ● | ✎ ○ ○ | ○ ○ ○ ○ ○ ○ ○ ● | | | | | | | |
| Android Autofill Service | ● | ✎ ○ ○ | ○ ○ ○ ○ ○ ○ ○ ✎ | | | | | | | |

User interaction always required
 Maps credentials to domains
 Won't fill HTTPS → HTTP
 Won't fill HTTPS → bad cert
 Prevents access from hosting app
 Fills password only on transmission
 Won't fill different action (static)
 Won't fill different action (dynamic)
 Won't fill cross-origin iframe

● Secure behavior ○ Insecure behavior ✎ Delegated to password manager

Violation P3

- A host app should not be able to access credentials filled into a `WebView`
- Both iOS and Android allow JS callbacks

Summary & Recommendations

- P1: Users explicitly authorize operation
 - Obeyed by all mobile autofill frameworks in all contexts
- P2: Credential is securely mapped to web domain or app
 - Need a secure bi-directional app-to-domain mapping
 - Should disable autofill in cross-origin iframes
- P3: Credential is only accessible to mapped domain
 - Need secure autofill in WebView and Browser
